

CLINICAL TOOL / LOCAL WEB APP

Radiant QuikBolus

DICOM RT Structure Set to printable bolus STL — or printable Flexibolus mold — in minutes.

Who it's for: Built for clinical physicists and dosimetrists running an in-house 3D-printing program for custom bolus or Flexibolus casting.

KEY FEATURES

- **DICOM RT Import.**
Reads the RT Structure Set and auto-detects Body / External and Bolus ROIs — no manual tagging.
- **Watertight Solid Mesh.**
Voxel reconstruction + marching cubes + repair pipeline; the exported STL is always a sealed, manifold solid.
- **Direct-Print Path.**
Print the bolus in TPU 95A. Print profiles bundled for Bambu, Orca, PrusaSlicer, and Cura with the right infill (100% for water-equivalence) baked in.
- **Mold Workflow.**
Or design a two-part rigid mold for casting Flexibolus — single or stepped parting plane, registration pegs, draft, embossed patient ID, undercut detection, validation panel.
- **Live 3D Preview.**
Three.js viewer renders the bolus or mold halves color-coded in the browser; rotate, zoom, sanity-check before printing.
- **Operator Cast Sheet.**
Every mold export ships with a Radiant-branded PDF covering cast recipe, wall-thickness QA, build diagnostics.
