# Radiant QuikCalc

*Independent MU checks, radiobiology, and treatment-gap calculations.*

| RESULT             |                                                        |
|--------------------|--------------------------------------------------------|
| <b>PASS</b>        | Computed MU = 299.85 (TPS = 300.00, $\Delta$ = -0.05%) |
| INPUTS             |                                                        |
| Method             | TG-114                                                 |
| Energy             | 6 MV                                                   |
| Rx Dose / Fx       | 200 cGy                                                |
| Depth              | 10 cm                                                  |
| Field Size (eq sq) | 10 cm                                                  |
| SSD                | 100 cm                                                 |
| PDD                | 0.6670                                                 |
| Output Factor      | 1.0000                                                 |
| Calibration        | 1 cGy/MU                                               |
| TPS MU             | 300                                                    |
| Beam ID            | LA1-6X-G0                                              |
| OUTPUTS            |                                                        |
| Computed MU        | 299.85                                                 |
| % Difference       | -0.05                                                  |

**Who it's for:** Built for clinical physicists doing second-check calculations, reirradiation analysis, and treatment-gap evaluations.

## KEY FEATURES

- **TG-114 MU Verify.**  
Independent monitor-unit check using the TG-114 hand-calculation method, with  $\pm 3\%$  action and  $\pm 5\%$  fail tolerances.
- **Orton-Ellis TDF Gap.**  
Treatment-gap evaluation that reproduces the EQD2 / TDF decay workbook bit-for-bit.
- **Branded PDF Reports.**  
Every tab produces a Radiant-branded PDF report, ready to drop into the chart.
- **Radiobiology.**  
BED and EQD2 via the linear-quadratic model, with unlimited prior courses and an editable alpha/beta reference table.
- **General Tools.**  
Inverse-square correction, temperature-pressure (P\_TP) correction, and long-interval prior-decay references.
- **Self-Contained.**  
Pure manual entry — no ESAPI, no internet, nothing to install.
